Environmental, Industrial and Renewable Energy
Comprehensive and Creative Solutions to Complex Environmental Problems

Pinnacle Engineering, Inc.

August 16, 2010

On May 13, 2010, the U.S. Environmental Protection Agency (EPA) issued a new regulation addressing greenhouse gas (GHG) emissions from industrial facilities. The rule sets thresholds for GHG emissions that define when permits are required for new and existing industrial facilities. The new rule will become effective on January 2, 2011 and will be rolled out in two phases. The first phase, January 2, 2011 to June 30, 2011, will only require sources undertaking permitting actions "anyway" for other pollutants to consider GHGs as part of the permitting process. The second phase, July 1, 2011 to June 30, 2013, will require sources that emit or have the potential to emit GHGs at or above 100,000 tons per year Carbon Dioxide Equivalence to consider GHGs as part of the permitting process.

Facilities responsible for nearly 70 percent of the national GHG emissions from stationary sources will be subject to permitting requirements under this rule. This includes, but is not limited large GHG emitters such as power plants, refineries, and cement production facilities.

Let Pinnacle help you determine how the GHG Tailoring Rule will impact your facility. Pinnacle has prepared over 500 air emissions permit applications for industrial and manufacturing facilities. Our service continues long after the permit has been issued and will help you with permit compliance requirements such as stack testing, deviation reports, emission inventory reports, and other facility specific requirements.

Contact your Pinnacle representative or our main office today for more information.
